

Ameracore Cleaning Recommendations

Ameracore's aluminum composite panels come coated with high quality paint designed for premium aesthetic appearance and minimal maintenance. We recommend cleaning the painted surface to maintain the best appearance.

The amount and frequency of dirt accumulation on Ameracore's ACM depends on the building's geographical location, the panel location on the structure, local soil type, weather, pollution and air conditions.

Do not use steel wool, abrasives or anything likely to abrade the painted surface. Some cleaning and chemicals can damage the surface. If unsure, test the application method and cleaning agents in an inconspicuous area. Start with the mildest cleaning methods first and, only if necessary, proceed to more stringent methods.

If dirt and stains are water soluble, such as soil, soot or particles, then a water rinse is the alternative least likely to degrade the painted surface. Do not, however, use a mechanical pressure washer.
